

# Project Submission 1

Team ' '; DROP TABLE team\_names;

September 24, 2019

We will divide the project into two parts.

## Filter List

This half of the team will be responsible for finding and combining filter lists in the most efficient way they can come up with. They have not currently decided on what filter lists to use, but they are confident that finding the filter lists and deciding on which ones to use will be a trivial task. The following members will be working on this half of the project:

- Andrew
- Trey

## Extension

This half of the team will be working on the Firefox extension itself, including a simple user interface and implementing the filter list to block ads. Firefox was chosen because of its Free and Open Source nature, as well as the fact that it more closely follows the proposed W3 Standards for browser extensions, while Chrome diverges from them often. JavaScript will be the language of choice, with HTML/CSS for the simple front-end. The following members will be working on this half of the project:

- Brandon
- Chase

## Collaboration

As a team, we will use a shared, private GitHub repository with several branches to share and maintain our codebase. We plan on having weekly or biweekly meetings to check in on our project's progress and see if either team needs extra assistance. We have also set up a group chat for instant communication as issues arise.
